Packaging solutions for firewood

1. Log-Lift®

Log-Lift was developed specially for the transportation, storage and drying of wood logs. This FIBC is made from UV stabilised polypropylene and is available in various sizes. The Log-Lift can be supplied with a print to 1 or 2 sides.

2. Net bags

Net bags are ideal for packing smaller quantities of firewood and kindling. The net bags are available in woven and monofilament fabric, in various colours and sizes and can be provided with a drawstring. NNZ also supplies pallet net for optimal transport and storage of firewood.

3. PP woven bags

Woven PP bags are the optimum packaging for wood pellets and charcoal. These bags are very strong and can be filled both manually and automatically.

4. PE bags

Polyethylene bags are used for packing oven dried wood pellets. These bags ensure clean transportation. PE bags can be supplied in many types and sizes with printing up to 8 colours for quality presentation.

5. SnapLog® bags

The SnapLog closure system provides a snap (quick) closure of the net bag. It can not be opened after closure and is strong enough to hold the weight of the bag when lifted. It is easy to lock/close the bag and tests have proven 10% higher packing capacity.

6. Paper bags

Multi-layer paper bags are used for packing charcoal, briquettes and kindling. NNZ supplies a wide range of paper bags in various sizes, weights and models.
